FW Market Size

FW Market Size

Future Works sells against a specific problem, not an industry. The market frame below is sized around that problem: AI that reaches production inside companies running large-scale physical operations, delivered on outcome-staked commercial terms.

> Aligned to Positioning R11, locked 28 August 2026. Updated 4 September 2026. See the note under "Who counts as addressable": the company-count figure predates the R11 size change and is being re-derived.

The problem defines the market

BCG's 2024 AI at Work study found that **74 percent of enterprises show no measurable value from AI investment**. That is the addressable pain. Every pilot that never touched the P&L, every roadmap that stalled at year two of a three-year integrator contract, every AI Centre of Excellence that produced slides instead of production systems.

Future Works is the transformation engine that closes that gap. Vendors evaluating a partnership with us should size their opportunity against the same pain, not against the broader "digital transformation" category that includes cloud migrations, CRM rollouts, and website builds.

Who counts as addressable

The Future Works offer is industry-agnostic, but three traits qualify an account:

1. A real P&L problem AI can move.
2. An executive willing to sign for outcomes.
3. An operator-level champion inside the business.

The profile: large and mid-market companies running large-scale physical operations. Outbound targets Core accounts only, meaning 500+ employees and roughly $200M+ revenue, sweet spot $1B to $20B, with no upper ceiling. Geography is United States primary and Canada full. European-only accounts are disqualified. Startups are not in scope, and vendors positioning against startup buyers should not expect co-selling motion here.

In the US, roughly **30,000 to 50,000 companies** have historically been counted as fitting this profile.

> **Figure under revision.** That range was derived against the earlier ICP floor of 1,000+ employees and $500M+ revenue. R11 lowered the outbound floor to 500+ employees and roughly $200M+ revenue, which widens the pool. Treat 30,000 to 50,000 as a conservative lower bound until the count is re-derived. Ask your Future Works contact before using it in a partnership model.

TAM, SAM, SOM

Sizing anchored on the problem set (production AI inside large-scale physical operations), not on the general digital transformation market.

Layer	Definition	Size
TAM	Global enterprise spend on AI operationalization, agentic workflow deployment, and outcome-staked transformation services	~USD 180 billion, growing 30 to 40 percent per year through 2030
SAM	US portion of TAM inside the four Future Works capabilities (AI Operationalization, Supply Chain and Fulfillment Transformation, Agentic Workflow Execution, Operational Resilience and Working Capital)	~USD 55 to 70 billion
SOM	US operators in the Future Works ICP, sized at target per-engagement Value Created ($600k+ annualized on a $410k Cycle 1 fee) across a realistic 24 to 36 month capture	~USD 2 to 3 billion of contracted revenue potential over the next three years

Growth is driven by three shifts, not one:

- CIO and CSCO tier buyers moving from vendor shortlists to problem-led searches (AI operationalization, S&OP optimization, working capital release).
- The 74 percent AI-value gap forcing enterprise budgets from pilot portfolios into production commitments.
- Outcome-staked commercial models eroding the time-and-materials pyramid that Tier 2 SIs depend on.

Value per engagement (the unit vendors should model against)

Vendors partnering with Future Works should size their revenue opportunity against the engagement structure, not against industry averages.

Metric	Value	Source
Cycle 1 fee (Foundation, single domain)	USD 410,000	PHL-1 SOW, March 2026
Target Value Created per Cycle 1 (annualized cost reduction, Finance-validated)	USD 600,000 to 800,000	Cycle 1 tranche structure
Overdrive Bonus above target	15 percent of every dollar above target, capped at 24-month annualized run rate	Cycle 1 tranche structure
Cycle 2 standard fee (Foundation Pod plus Scaling Pod)	USD 650,000	Modular Rate Card
Typical program: three Cycles across 9 to 12 months	USD 1.5 to 2.5 million contracted	Master Program framework

A third of every Cycle fee rides on the value target the client's Finance team validates. A miss converts that tranche to a Service Credit against the next Cycle. A beat triggers the Overdrive Bonus. Vendors should assume roughly two-thirds of a Cycle fee is base and one-third is contingent.

Keep these numbers in commercial conversations. They do not belong on public surfaces.

Where the money has actually moved

Vendors asking "who buys this?" should look at where Future Works has delivered Finance-validated outcomes. Industries are proof, not the offer, and the offer is identical across all of them: twelve-week cycles, named senior experts orchestrating fleets of AI agents, a third of the fee staked on Finance-validated outcomes.

The industry wall is 14 tiles. The first five are Tier 1 and carry active outbound. The rest are watch and inbound: we serve them and publish for them, but we do not run outbound into them in this phase.

Tier 1 (active outbound), with proof:

- **Manufacturing and Industrials**: Markforged, plus the advanced manufacturing estate.

- **Energy**: NextPower, First Solar, Last Energy, Amperon. NextPower delivered 75 percent faster time to market.
- **Health and Life Sciences**: anchored by Philips, which delivered a 3x return in twelve weeks, Finance-signed and self-funding the next cycle.
- **Logistics and Transportation**: the supply chain and fulfillment estate.
- **Consumer Products**: GNC, plus the consumer goods estate.

Watch and inbound, with proof:

- **Aerospace and Defense**: Boom, Astroscale, Ursa Major, Virgin Galactic. Outbound stays commercial aerospace; defense is watchlist only.
- **Commercial Real Estate**: JLL, CBRE, Tritower Financial Group. JLL unlocked a two-year AI roadmap in four weeks. Warm inbound only, not an outbound target.
- **Retail**: Staples, which shipped twenty digital products in twelve weeks.

Supply chain is a capability, not an industry. The former "Industrial Supply Chain" cluster has retired into the Supply Chain and Fulfillment Transformation capability.

What this means for vendors

- **Buyer titles to align to**: CIO, CDO, CIDO, Chief Digital and Transformation Officer, Global Head of IT and Process Excellence, Chief Supply Chain Officer, Chief AI Officer, Chief Innovation or Transformation Officer, COO. CFO and CEO are influencers who can block, so risk-absorption language matters.
- **Contract shape to expect**: a Master Program Framework, activated Cycle by Cycle against a published Modular Rate Card, with email-level Activation Confirmation replacing per-phase MSA negotiation.
- **Where partners plug in**: the stack is vendor-agnostic by design, built on AWS, Azure, and Databricks, with GDPR-compliant delivery and SOC 2 Type II and ISO 27001 certification audits in progress and on schedule. Describe these as audits in progress, never as held certifications. Integrations that survive procurement do so because they slot into the existing client estate, not because they require platform adoption.
- **Growth trajectory to plan around**: the SI replacement thesis is where the SOM expands fastest. Every Cycle Future Works ships against an incumbent integrator increases the addressable pool of CIO conversations willing to hear an outcome-staked pitch.

The market is not the digital transformation category. The market is production AI, staked on outcomes, inside companies that carry real P&L weight in the physical world.
